

Bank Portal Authentication System

Rishikant Sharma | Roll Number: CS-23411287 | IILM University

Project Overview

Secure by Design

A robust authentication system built specifically for bank portal environments, protecting user data at every layer.

Multi-Layer Security

Combines JWT token management and Two-Factor Authentication for defence-in-depth security.

User-Friendly Flows

Intuitive registration and login workflows designed for clarity without sacrificing security.

Key Features

User Registration

Sign up with email and phone number for a verified account identity.

Email OTP Verification

One-time passcodes sent via email activate and validate each account.

Secure Login & Password Hashing

bcrypt-encrypted credentials ensure passwords are never stored in plain text.

JWT Session Management

Stateless token-based sessions keep the portal fast and secure.

TOTP Two-Factor Authentication

Time-based one-time passwords add a critical second layer of protection.

Registration Process

A streamlined four-step process ensures every account is verified and secure before access is granted.

Login Process

Step-by-Step Login Flow

1 Navigate to Login

Click "**Login**" in the portal navigation bar.

2 Enter Credentials

Provide your registered **email address** and **password**.

3 2FA Verification

If 2FA is enabled, enter the **6-digit authenticator code**.

4 Access Dashboard

Gain secure access to your **personal bank dashboard**.

Two-Factor Authentication Setup

1

Prompted After Login

System prompts 2FA setup on first successful login.

2

Scan QR Code

Use any authenticator app (Google, Authy) to scan the displayed QR code.

3

Verify 6-Digit Code

Enter the time-based code generated by your authenticator app.

4

2FA Active

All future logins now require the authenticator code for access.

❏ TOTP codes refresh every 30 seconds — ensuring no code can be reused by an attacker.

Authentication Features

Email OTP Verification

Secure account activation through one-time passcodes delivered to the registered email.

Password Hashing

bcrypt encryption ensures all passwords are salted and hashed — never stored in plain text.

JWT Tokens

Stateless session management via signed JSON Web Tokens for scalable, secure access control.

TOTP 2FA

Time-based one-time passwords provide a dynamic second factor that expires every 30 seconds.

Backend Technologies

Powering the Secure Backend

The picture can't be displayed.

Node.js Runtime

High-performance JavaScript runtime for handling concurrent authentication requests.

The picture can't be displayed.

Express.js Framework

Lightweight and flexible REST API framework powering all authentication routes.

The picture can't be displayed.

JWT · bcrypt · Speakeasy

Industry-standard libraries for token signing, password hashing, and TOTP generation.

The picture can't be displayed.

Nodemailer

Reliable email delivery service for dispatching OTP verification codes to users.

Frontend Technologies

HTML₅

Semantic markup delivering accessible, well-structured portal interfaces.

CSS₃

Modern styling for a clean, responsive bank portal experience across devices.

JavaScript ES6+

Dynamic client-side scripting enabling real-time validation and interactive flows.

QR Code Library

The *qrcode* library renders TOTP QR codes for seamless authenticator app setup.

Security Highlights & Benefits

Why This Architecture?

The Bank Portal Authentication System is built on **four complementary security layers**, each addressing a distinct threat vector:

- **Multi-layer authentication** ensures no single point of failure exists in the login flow.
- **bcrypt password hashing** makes brute-force attacks computationally infeasible.
- **Time-limited OTPs** for email verification prevent replay attacks.
- **TOTP 2FA** guarantees that even stolen credentials cannot grant unauthorized access.

Together, these layers deliver **enhanced security**, a **seamless user experience**, and **industry-standard practices** — with a scalable architecture ready for future enhancements.
